GUARDIAN[®] LIMB SALVAGE SYSTEM

The GUARDIAN[®] Limb Salvage System is ideal for cases when proximal or distal femur replacement can no longer be achieved due to extensive femoral and tibia bone loss as a result of cancer, trauma, or failed hip and knee arthroplasty. The system offers operative flexibility, component modularity, and complete instrumentation and trials.

distal FEMUR

The rotating hinge design allows salvage in cases where bone loss is so great that the ligaments cannot be saved. The constrained design precludes the need for a patellar component. The prosthesis consists of a femoral stem, optional midsection, hinged femur/tibia, axial pin, polyethylene spacer, tibia sleeve, and an optional tibia stem extension.

proximal TIBIA

The resurfacing femur design allows for only 28mm of femoral bone resection and is available in a wide range of sizes that promote optimal prosthesis fit. The constrained design precludes the need for a patellar component. The prosthesis consists of a femoral stem, resurfacing hinged femur/tibia, axial pin, polyethylene spacer, proximal tibia, optional midsection, and tibia stem.

proximal

The prosthesis consists of an optional midsection, proximal tibia, and 32mm stem. The prosthesis is available in the Bipolar System and Medical Technology.

distal FEMUR

proximal TIBIA

proximal FEMUR

The proximal femur prosthesis consists of a femoral neck, proximal femoral resection and a stem. The femoral head is available in two sizes: Cobalt-Chrome or Alumina ceramic. The proximal femur is available in a choice of 22mm, 28mm and 34mm diameters in varying neck lengths. The proximal femur is fully compatible with the SLR, Endo heads, and all Wright technology acetabular cup systems.

proximal FEMUR

total FEMUR

The total femur prosthesis consists of a femoral neck, optional midsection, male/male midsection, hinged femur/tibia, axial pin, polyethylene spacer, tibia sleeve, and an optional tibia stem extension.

total FEMUR

revision HINGE

The resurfacing femur design allows for only 28mm of femoral bone resection and is available in a wide range of sizes that promote optimal prosthesis fit. The constrained design precludes the need for a patellar component. The prosthesis consists of a femoral stem, resurfacing hinged femur/tibia, axial pin, polyethylene spacer, tibia sleeve, and an optional tibia stem extension.

revision HINGE

- Overnight delivery available to meet critical demands.
- Customized implants available to meet special sizing needs.

For augmenting bone loss or for bone repair and enhanced fixation, try ALLOMATRIX® Injectable Putty.
